genomic landscape of *Clostridium difficile*

pseudomuramidase assembly in PhyloTree. TcdE is a

pseudomuramidase from *Clostridium difficile* that enables

the pathogen to resist human gut peristalsis. The pathogen has evolved the ability to bind to lactoferrin via the fucose-

containing cell wall polysaccharide, lipoteichoic acid. Pseudomuramidases, including TcdE, are one of the few families of enzymes that can cleave glycosidic bonds in an insoluble exopolysaccharide. An in vivo study revealed that TcdE, when secreted, can play a role in host-pathogen interactions by modifying host cell surface glycans and promote stronger binding to the host epithelium. Using basic and advanced bioinformatics tools, we have examined the genomic context of TcdE in PhyloTree. The genomic context of TcdE genes revealed that the TcdE gene is likely to be an N-acetylglucosaminylphosphatidylinositol-anchorless periplasmic protein. However, the TcdE amino acid sequence is well-conserved in various bacterial species, which suggests that TcdE belongs to a family of M23 family periplasm
