

45. Aringazi, R. P. STRS Radio Frequency Interference Handbook, 2 ed. a. The IEEE 303/282 standard (IEEE Std 1236-1990) specifies the signal specification and radio frequency emission equipment in the nation's telecommunications system is from 14 MHz to 300 GHz (24.14 Appendix E, standardize the use of spectrum in the United States for specific application case, such as VHF for television, UHF for broadcast, and UHF for land mobile radio. the big daddy of all decentralised cryptocurrencies, the ethereum blockchain. It was a time when Ethereum was new and being pioneered in its development and just starting to have some real applications and use-cases built on it, mainly in the finance field. It's no wonder that some people are working on Ethereum based dapps today. Some of the most popular are – Uniswap, Kauri, Augur, OpenLaw, and Request Network, to name a few. It's a good time to take a look at the history of this blockchain as well as the different problems that led to it to be the what it is today. Bitcoin, a conceptual cryptocurrency, seems to be the ideal asset to be a decentralised autonomous organisation and run by the users themselves. It's also pretty much the only one out there and it also pretty much has a clear, documented protocol about how the network functions, and how you can transfer money in or out of it. Being the Bitcoin protocol creates a problem when you consider the problems that the ledger is held by a third party (users) that is not entirely aware of what is occurring on the network. Another problem (and indeed possibly the most important and one that has caused huge problems over the years) is the fact that this ledger is not decentralised. Every transaction needs to be validated by a network that is potentially, and in theory, controlled by a distributed network of users and nodes. This has caused a number of problems that have been talked about over the years, problems that have resulted in the creation of multiple different models of consensus and problems that have tried to alter that consensus. Basically, Bitcoin is only a decentralised if every user on the network agrees to it. If a transaction gets through that is in some way contested by another user, or is within some kind of deadline of another user, or there are multiple parties involved
