The cooling of the processor of the video card is integrated in the cooling system of the videocard. On video cards of the higher end of the market, there is often no fan of the videocard. In this case, the cooling system consists of a thermal compound (heat spreader with thermal paste) between the processor and the videocard. When the processor overheats, it will therefore be impossible to make the PC usable. NVTweak fixes this problem. This application allows you to display the current temperature and shows the maximum and minimum temperature values. It displays the instantaneous temperature graph. This application can be used to adjust the fan speed of your videocard. For the videocard as the fan speed increases, the processor of the videocard will be cooled more. This will then help to increase the life expectancy of the videocard. Monitoring of the fan speed is done by using the internal GMA-x BIOS! Regarding the fan speed, NVTweak was specially developed to be sure that it is compatible with all videocards. NVTweak was originally designed to be installed on videocards using the Z77 interface, but now it can also be used on videocards using the ICH10, ICH9 or ICH8 interface. By installing it on a videocard, you will have access to a cooling setup menu in the BIOS, and you can set the fan speed to minimum, maximum, automatic or disable it. By default, the fan speed starts at maximum, and therefore it is a simple way to increase the fan speed. It is estimated that for a videocard on the market it is possible to reduce the temperature of the videocard between 10°C and 20°C. If you use a videocard and use its fan to cool, NVTweak is recommended. If you have a videocard that does not support the installation of NVTweak, you can still take advantage of the fan speed. An advantage of this is that, when the temperature is right above the maximum, the fan speed will slow down, thereby allowing the processor to cool down, thereby preventing overheating! I like it and everyone should have it

What's New In NVTweak (Formerly Coolbits)?

NVTweak is a practical and easy-to-use tweak that allows you to control the PowerThrottling feature in a discrete GPU video card. When activated, this function lets you reduce the maximum CPU/GPU power consumption of your video card, for instance when you're gaming or watching videos. It provides a number of performance modes to choose from, and the PowerThrottling feature can be disabled as well. The program runs on Windows 2000, XP, Vista, 7, 8 and later.
