The Pixel A pixel is the basic building block of any digital image. In fact, an image is created by "painting" the pixels. This is an example of using the Pixel tool: The Dodge Tool makes an image darker or lighter. It is useful for correcting skin tone and correcting uneven exposure. The Burn Tool is similar to the Dodge Tool, only it allows you to darken the image. The Sponge Tool is a copy tool. You can use it to blot out areas of the image. The Blur and Sharpen tools are advanced that's why you rarely see them used. Using the Sharpen tool helps to reduce the effect of noise (stray pixels). The Smudge Tool is used for smudging an area of a photo. The Erase Tool is useful for removing unwanted objects from an image. The Move Tool allows you to move images and layers. The Type Tool is used for defining the type of an image. The Warp Tool is a clone tool that warps an object and transforms it. The Pen Tool is used to create cool text effects and drawings. The Paintbrush is used for painting, retouching, and compositing an image. The Pen Tool also has a clone tool. I used the clone tool a lot to copy and paste different areas of an image. Another great tool is the magic wand. Magic Wand allows you to select images based on certain conditions, such as similar color or tone, or edges. It can be used to select specific areas of your image. Layering is the ability to apply more than one file or layer onto your selected image. You can use it to combine images, change colors, paint in depth, or do any other image manipulation. To create a new file or layer, select the File > New or press the keyboard shortcut F2. You can also create a new layer within an existing image. A layer in Photoshop is the equivalent to a page in a book or a paper in a notebook. A Photoshop file is like a book or a notebook, and layers are like pages and pages of your book or notebook. You can add multiple pages, drawings, and other things to your Photoshop book, just like you would with any paper. You can also flip between pages, so to speak. Each page represents one screen (or window) in Photoshop. Layers are used for working with two-dimensional photos, drawings, or other

Blackfin tuna The blackfin tuna (*Thunnus atlanticus*) is a species of tuna in the family Thunnidae (Atlantic tunas). It is found along the eastern coast of North America, Europe, western Africa, and the northwestern Indian Ocean. **Anatomy** The blackfin tuna is a sizable fish. It is described by the International Union for Conservation of Nature (IUCN) as a super-sized tuna; its most common weight is 15.5 kg, though it may grow to 30 kg. Its body is similar to that of the Pacific albacore, consisting of a short, relatively thin head, medium-sized dorsal and anal fins, wide pectoral and caudal fins, a small dorsal spine, a symmetric caudal peduncle, and a narrow, sharply serrated, spiky dorsal ridge. A principal difference between the blackfin and the albacore is in the shape of its lower jaw, which, like that of the Pacific albacore, is pointed and U-shaped in cross section. However, the lower jaw of the blackfin tuna is flat, with a gently concave profile. The mouth is smaller and has fewer teeth than that of the Pacific albacore. The blackfin tuna's black dorsal and anal fins are larger and more pronounced than those of the Pacific albacore, and it is commonly regarded as a "flagship species" of the tuna genus *Thunnus*, which also includes several other larger-sized tuna species. The blackfin tuna is often misidentified as a black marlin, due to their similar coloration and size. **Distribution and habitat** The blackfin tuna, which is classed as a near-threatened species by the IUCN, is found in the eastern North Pacific Ocean, as well as the western Atlantic Ocean (north of Cape Canaveral, Florida), and the northwestern Indian Ocean. The blackfin tuna occurs throughout coastal and oceanic waters (including estuaries) from southern California, USA, to Florida, USA. It is a migratory species that may make seasonal excursions to deeper offshore waters when the coastal waters are crowded by the migration of other pelagic fish. A fairly common species off the coasts of southern British Columbia, Canada, it is also present off northern Vancouver Island. It is more abundant in the Pacific Ocean than in the Atlantic Ocean. In the Pacific
