Features of micro-electrode devices for delivering and measuring electrical stimulation to the central nervous system. A micro-electrode neural probe is a critical part of an electrode array used in chronic neuroprosthetic applications. The device must have minimal size and stiffness but must also be able to deliver a defined stimulation signal and measure a targeted biopotential. The three main contributions to implant size are usually attributed to the length of the implant, the geometric constraint of the interconnections between the electrode and the PCB, and the number of independent electrode contacts. The device is usually designed to measure from a few dozen to a few hundred microvolts with a bandwidth of several hundred kilohertz. Electrode impedance is a key feature, and in some designs it is relatively high but can be actively modified by using a microelectronic impedance combiner. Also important is the amount of electric field leakage produced by the electrode. Electrode impedance, electrode surface area, and surface area/impedance are related to each other, and the differential electrode impedance is generally high. The total impedance is dominated by the resistive component, which is controlled by the biocompatible interfacial impedance. Overall, biocompatibility is a major determinant of the performance of a neural electrode. "Will I have difficulty seeking a job? Is this a major disruption of my life? Is this going to be a long process?" The questions facing college graduates entering the job market for the first time after a decade of unprecedented increases in student debt are certainly as legitimate as the questions everyone else asks: What is a career? What do I want to do? How do I get there? These are all familiar tropes in a time that now demands a college degree for nearly all. Beyond the question of what degree to pursue, it's a good question to ask how much to borrow to go to school. Where to attend. What major to choose. What to major in. Who to marry. Who to marry to. Who to ask for a job. Who to ask for an interview. "Your Harvard degree gives you a quarter of a million dollar head start in the job search" According to a recent analysis by the New York Fed, the average student loan debt of recent college graduates in 2011 was roughly \$29,000. That's a third of the average annual income of a recent graduate and roughly the same amount as a young single person will pay in rent

Q: What are the benefits of using rake in rails app I have read a lot of posts on this topic, some say its faster others say its to give more test. I am bit confused here, so pls help me out. A: Rails is built on top of the Ruby On Rails framework, which uses what is called MVC architecture. Rake runs small and independent tasks that are a part of an application. What rake does Reads the spec file in app/rake and generates the Rakefile Loads all the task dependencies in the Rakefile Generates the rake task list from the Rakefile Ruby Tutorial Rake Tutorial A: Rake is a build tool and if you have to use it for any purpose then generally it seems slow. Rails is a framework which's job is to speed things up by doing stuff for you. So if you use it then your project is likely to be slow. On the contrary if you use Rake and then write code in a normal way then it would also be slow and there's nothing much your framework could do about it. When you create a project in Rails you create a set of tasks/methods which make the task of deploying/using your app faster. There is no standard rule about which task is better to use and no standard rule about when to use it so keep it simple, don't use it everywhere and only use it where it's really needed. An 8-year-old boy in the Dominican Republic died of radiation poisoning, amid a new wave of concern over food contamination in the country following a massive earthquake in the region, according to doctors. The boy, whose identity wasn't released, went in for a scheduled procedure on Friday for a cataract surgery, because he had been wearing glasses for a long time, according to the regional office of Santo Domingo General Hospital. "The surgeon said he noticed a big red spot on his eye. Then he became very aggressive and aggressive," said the boy's father, who is a volunteer EMT in a local police unit, adding his son's eyes swelled up. He said they took his son to a hospital, and several doctors confirmed they did find a "big red spot" on his eye, but his doctor and several other doctors said they only suspected radiation poisoning and took the boy to Santo Doming
